

Where to from here?

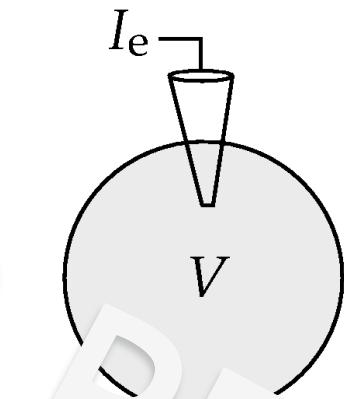

NOT
FOR
REUSE

Neurons have complicated spatial structures

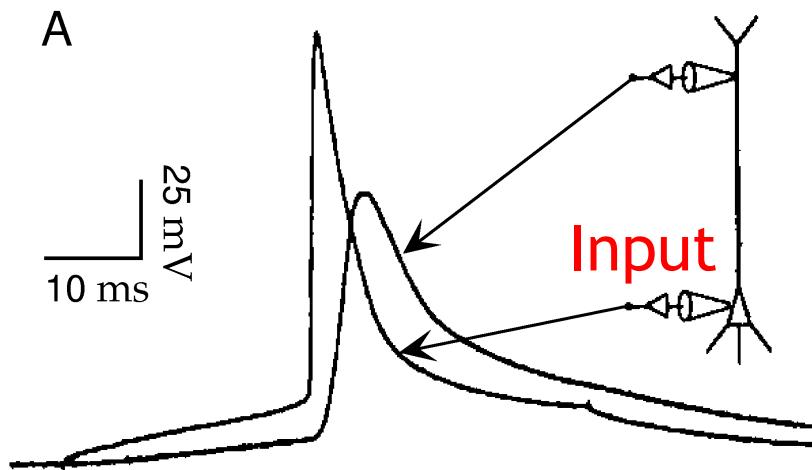

Real Neurons

?

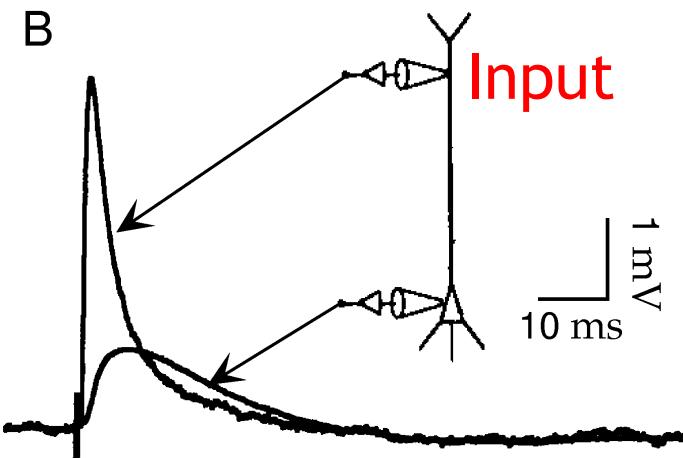

Our Model

Geometry matters!

Inject current at the cell body and record effect in a dendrite

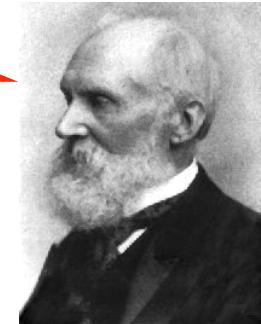

Inject current in a dendrite and record effect at the cell body

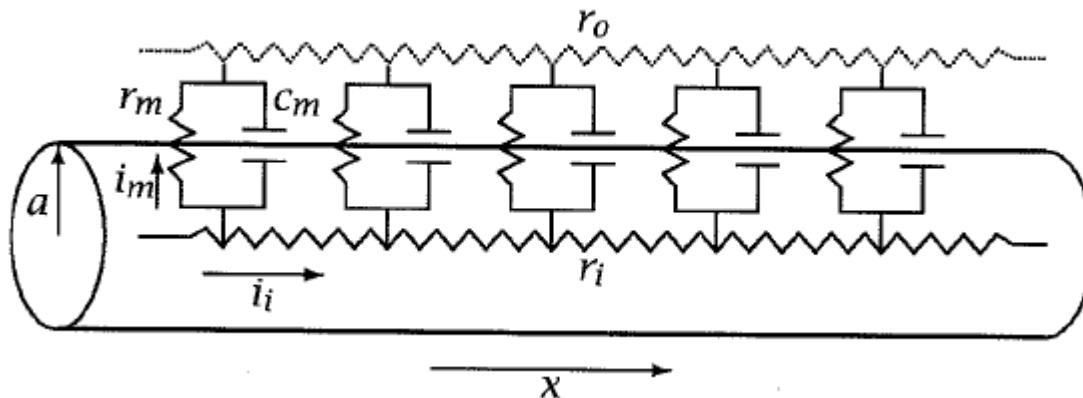

Voltage decays with distance in passive membranes (How?)

Linear cables

This problem sounds familiar!

Lord Kelvin
(1824-1907)
Developed cable theory for undersea cables

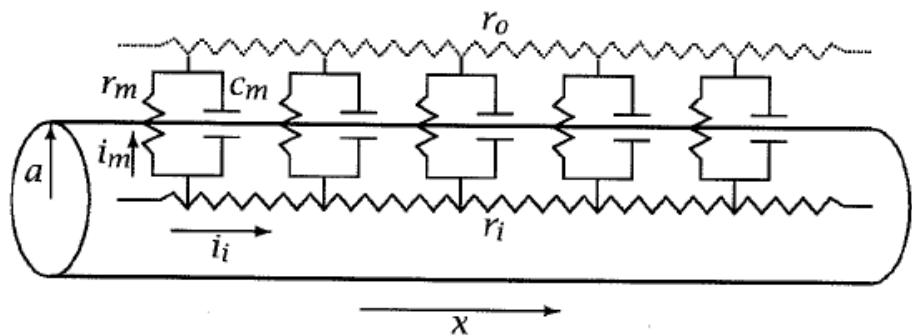

r_m and r_i are the membrane and axial resistances, i.e. the resistances of a thin slice of the cylinder

The cable equation

Before we had:

$$i_m = i_C + i_{\text{ionic}} = c_m \frac{\partial V_m}{\partial t} + \frac{V_m}{r_m}$$

Now we also have to consider i_i , the current down the cable, due to voltage changes in x .

That current works against internal resistance, r_i

$$\frac{1}{r_i} \frac{\partial^2 V_m(x, t)}{\partial x^2} = c_m \frac{\partial V}{\partial t} + \frac{V_m}{r_m}.$$

or

$$\lambda^2 \frac{\partial^2 V_m}{\partial x^2} = \tau_m \frac{\partial V_m}{\partial t} + V_m$$

where

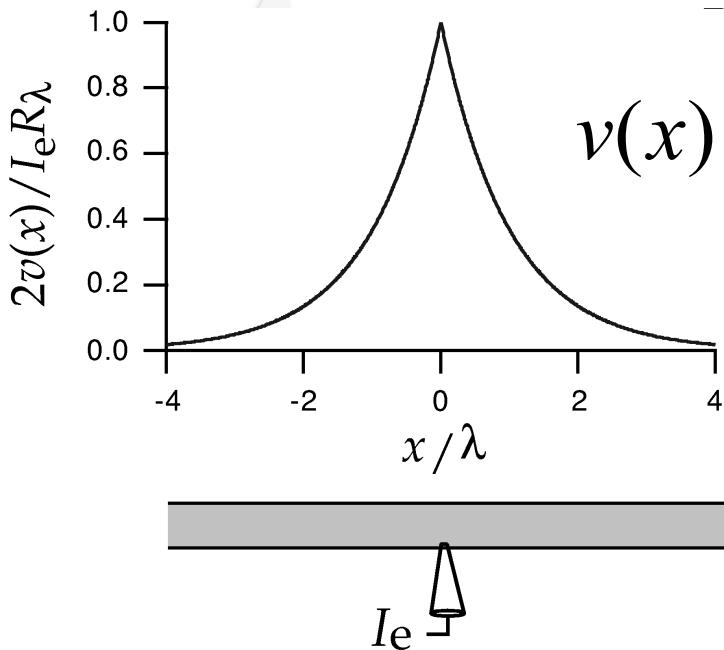

$$\tau_m = r_m c_m$$

$$\lambda = \sqrt{\frac{r_m}{r_i}}$$

Time constant

Space constant

How does voltage decay in space?

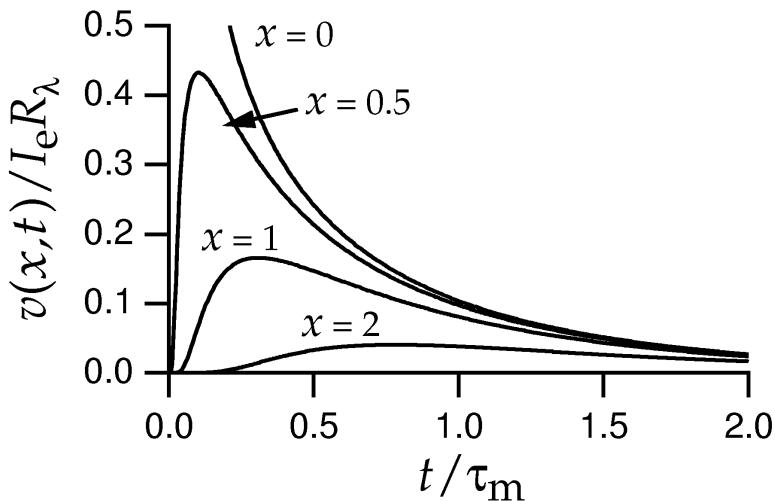

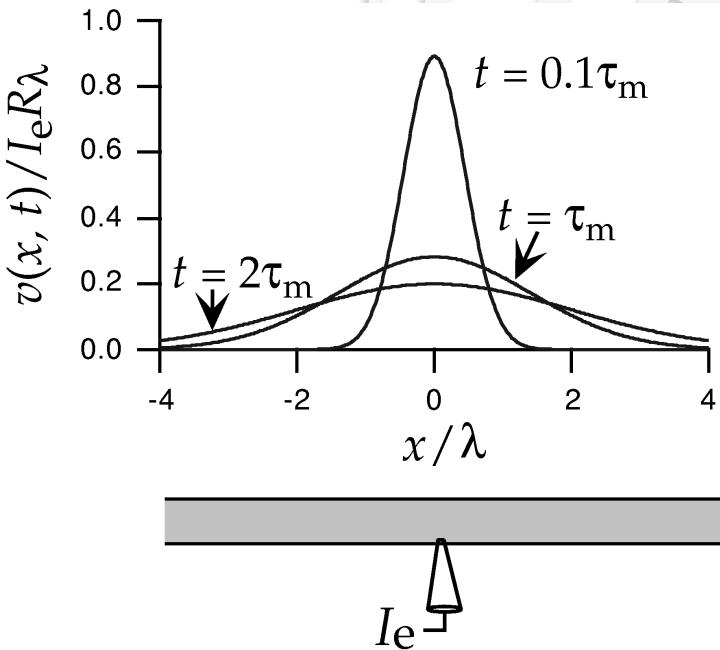

$$v(x) \propto e^{\left(-\frac{|x|}{\lambda}\right)}$$

Potential decays exponentially from $x = 0$

Infinite Cable,
Constant current at $x = 0$

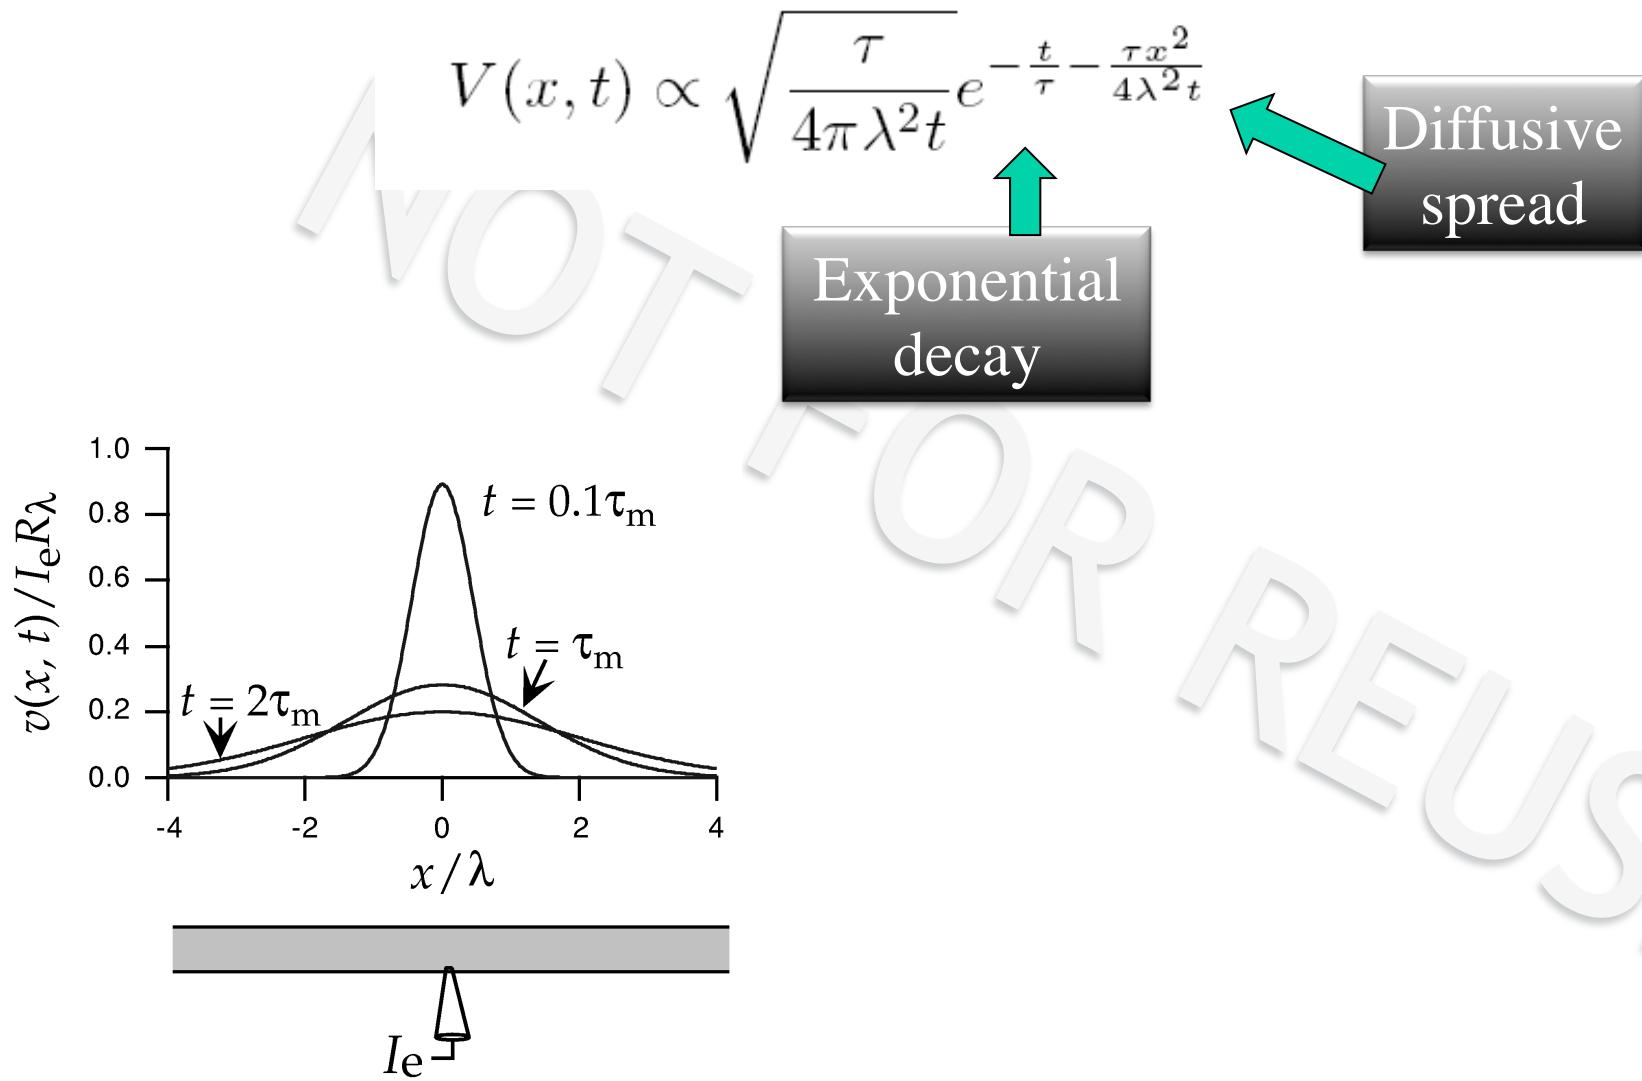

How does voltage decay over space and time?

Infinite Cable,
Current pulse at $t = 0$, $x = 0$

Potential peaks later (and
at lower values) for points
further away from input

General solution: filter and impulse response

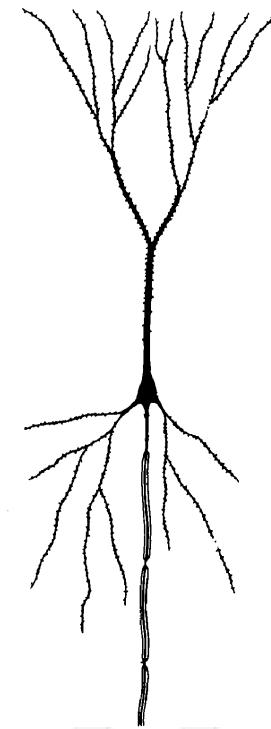

OK: now what?

1. The geometry can be extremely complicated

Cable Equation

$$\frac{1}{r_i} \frac{\partial^2 V_m(x, t)}{\partial x^2} = c_m \frac{\partial V}{\partial t} + \frac{V_m}{r_m} \cdot i + i_e$$

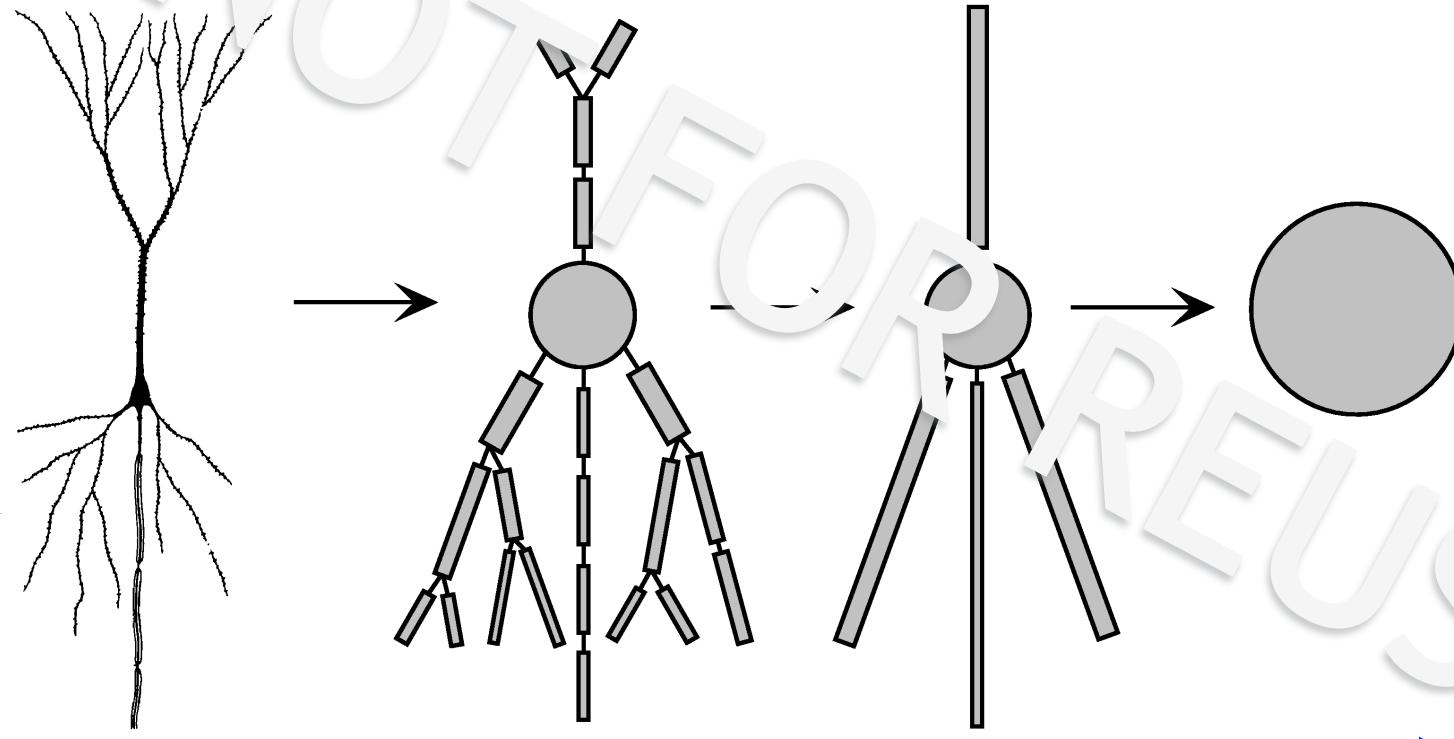

2. And, um, ion channels?

→ Quickly becomes intractable to solve analytically for realistic neurons

Solution: Divide and Conquer

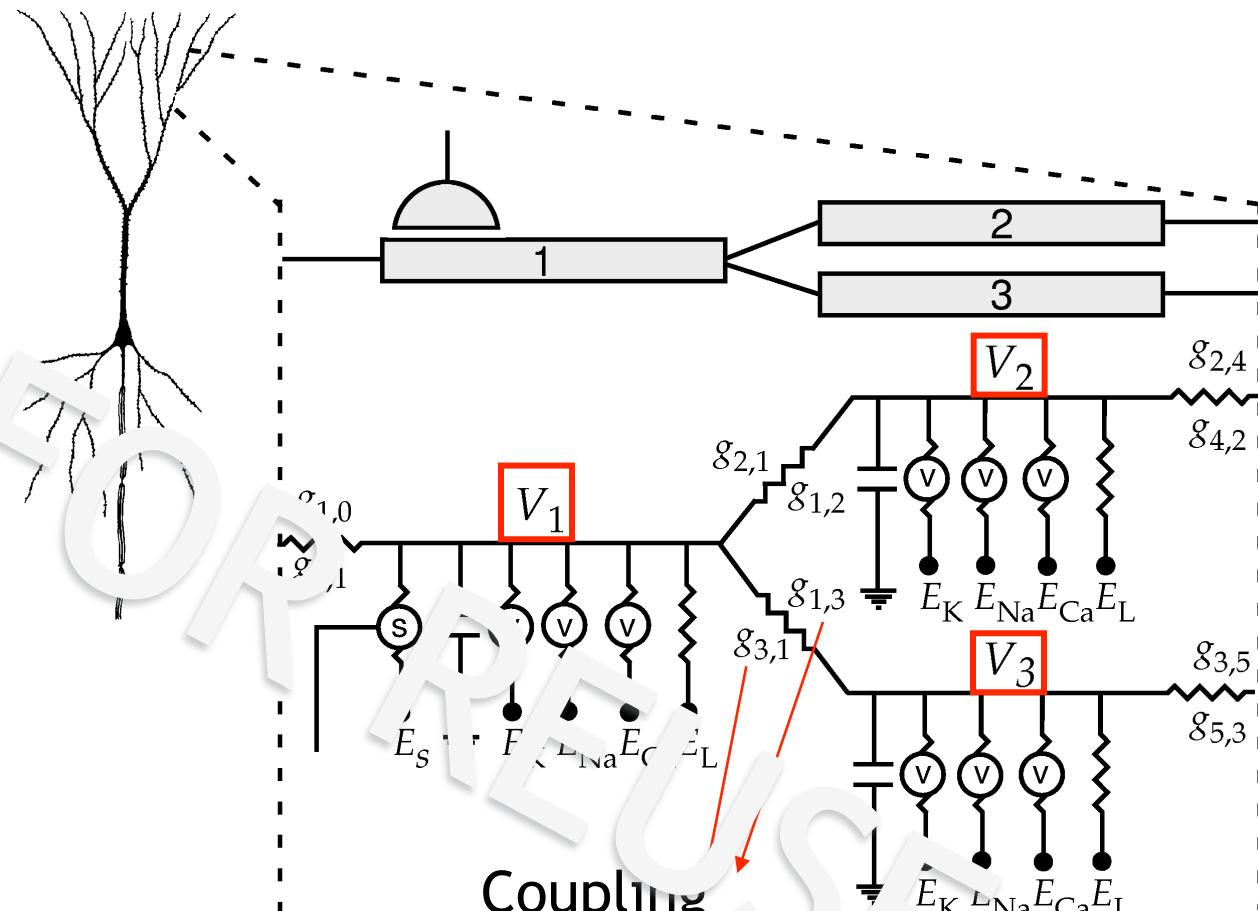

Compartmental models

Decreasing number of “compartments”
Each compartment = one dV/dt equation
(usually no dependence on x)

The gory details

NOT FOR REUSE

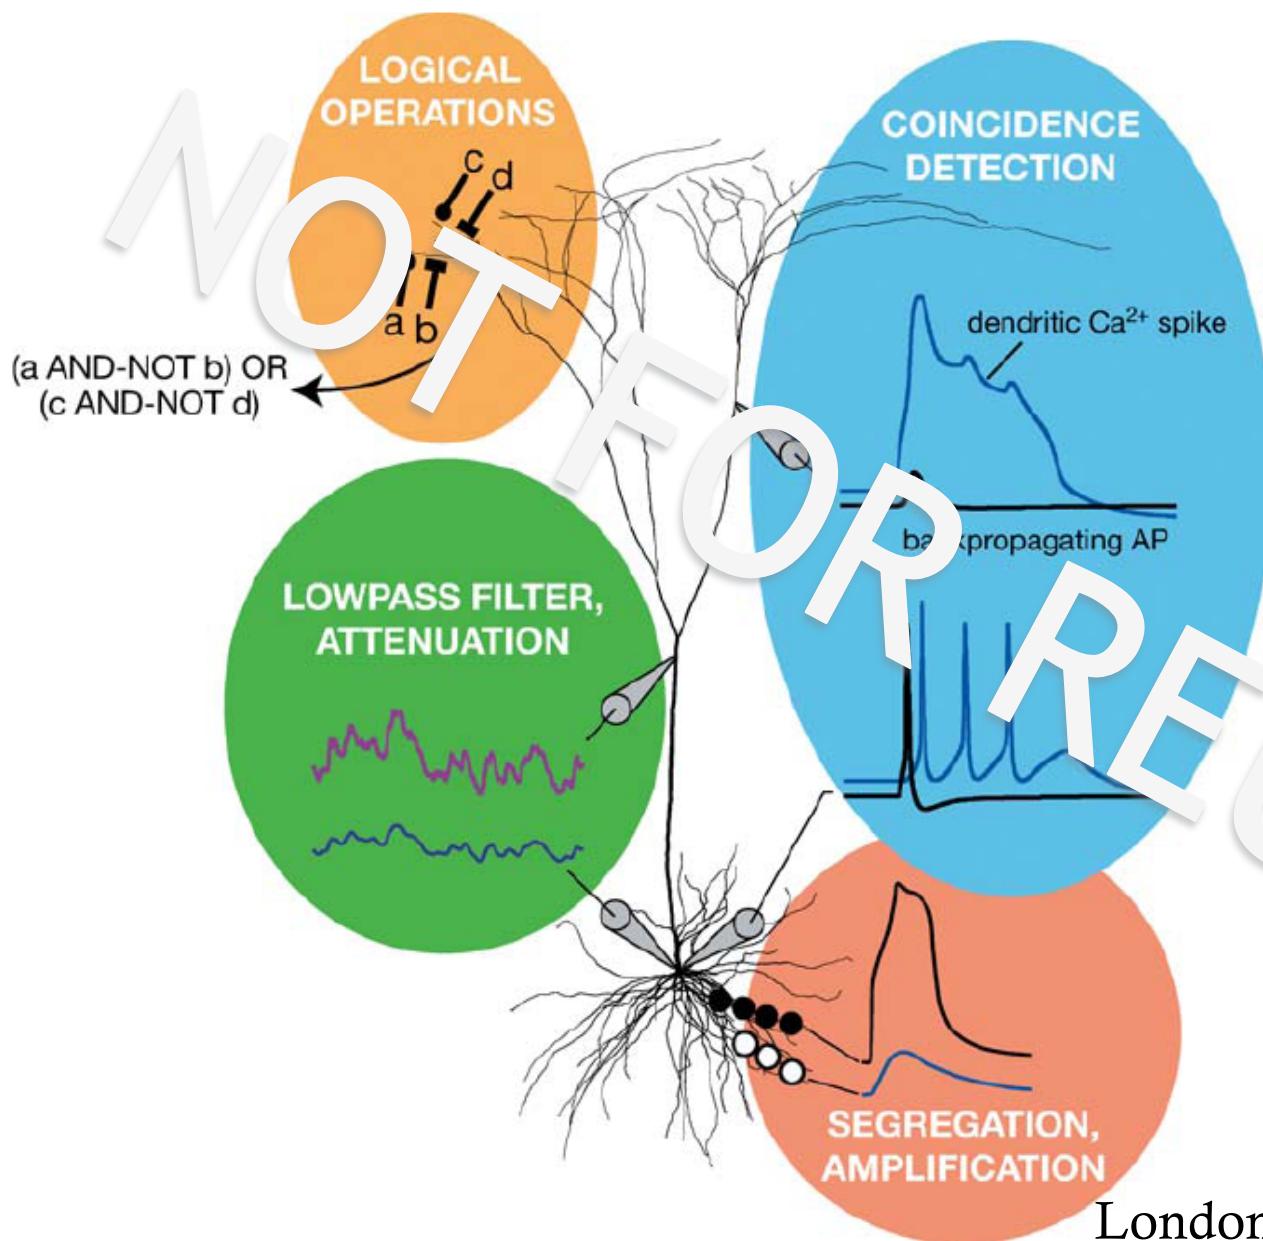

Coupling conductances

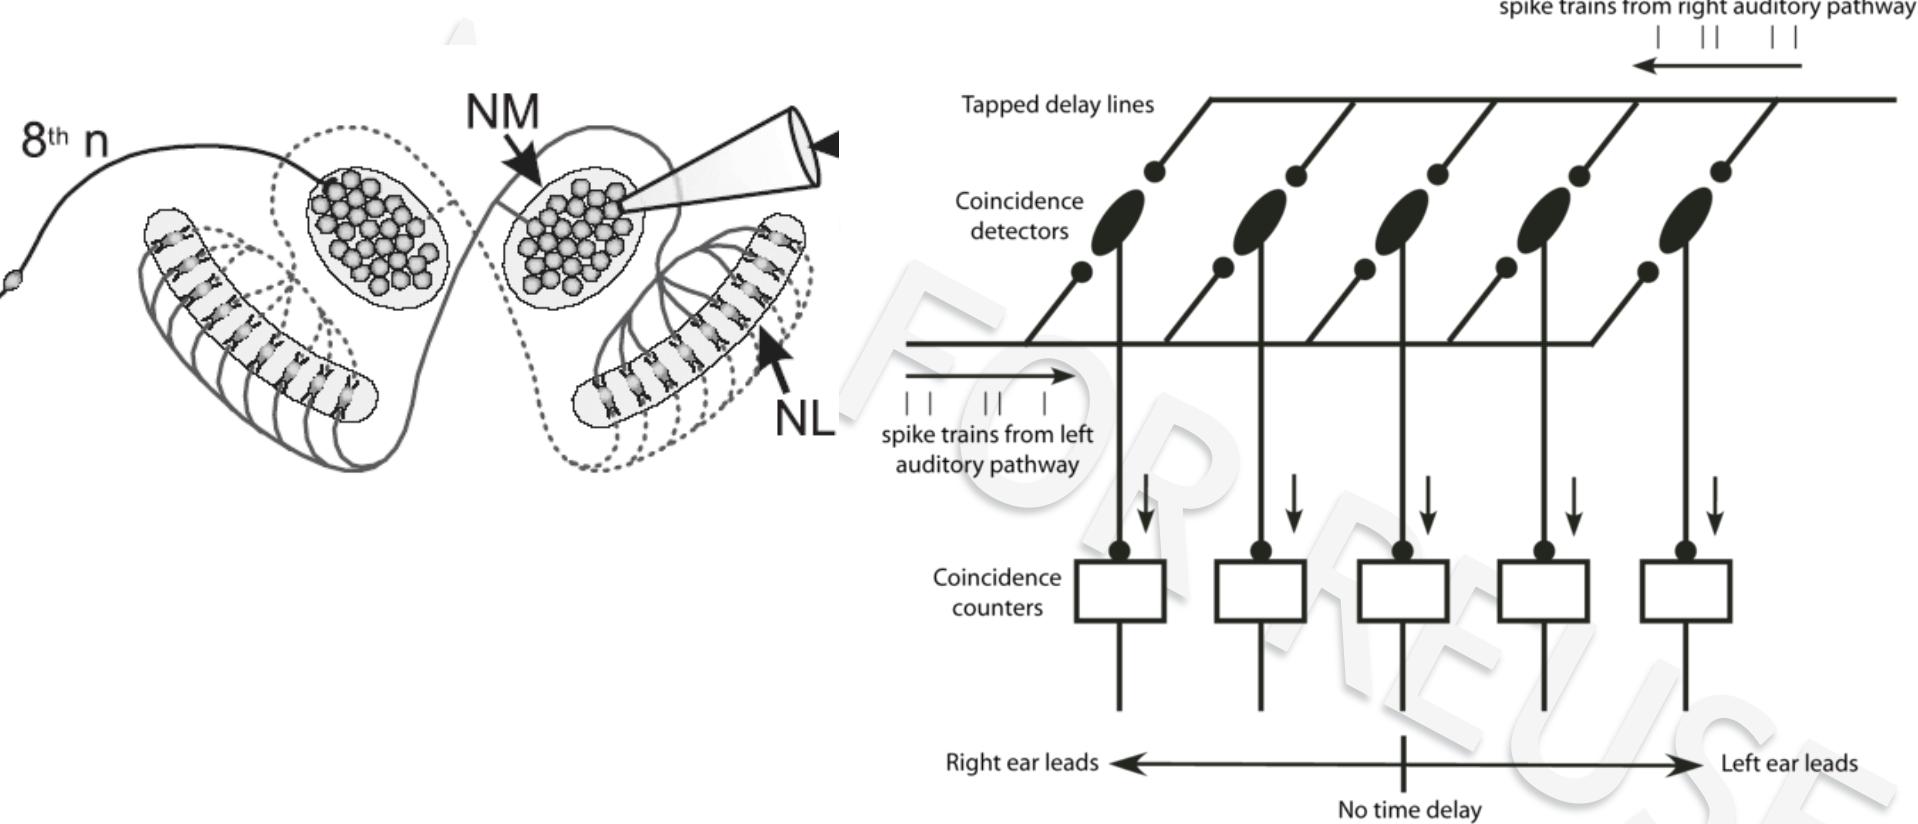

And now you
see why
Genesis and
NEURON were
developed—
thank you!

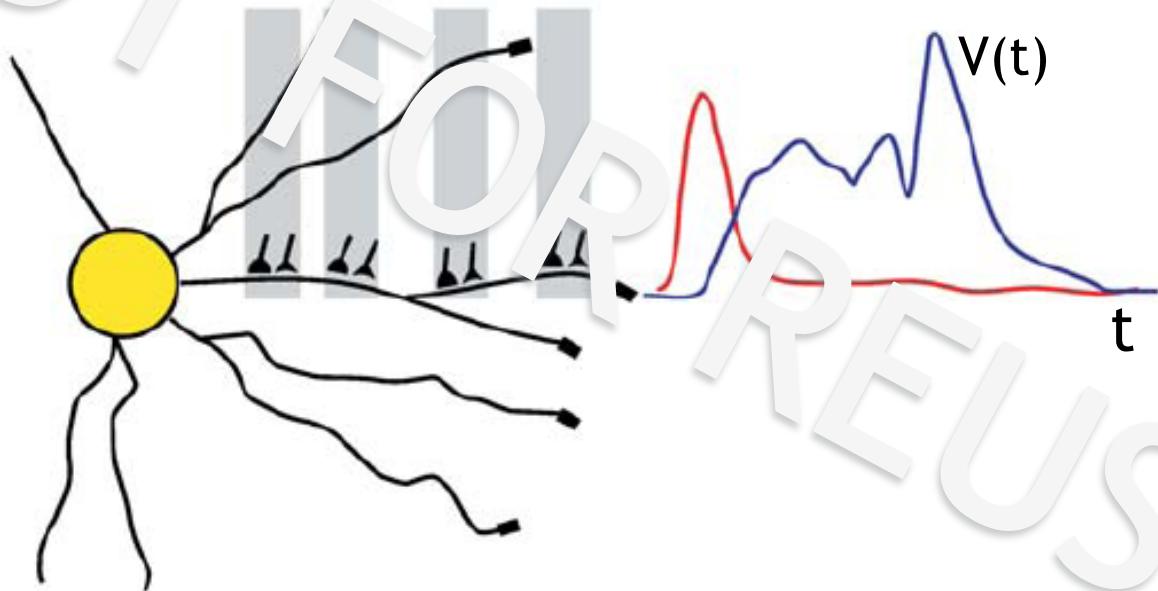

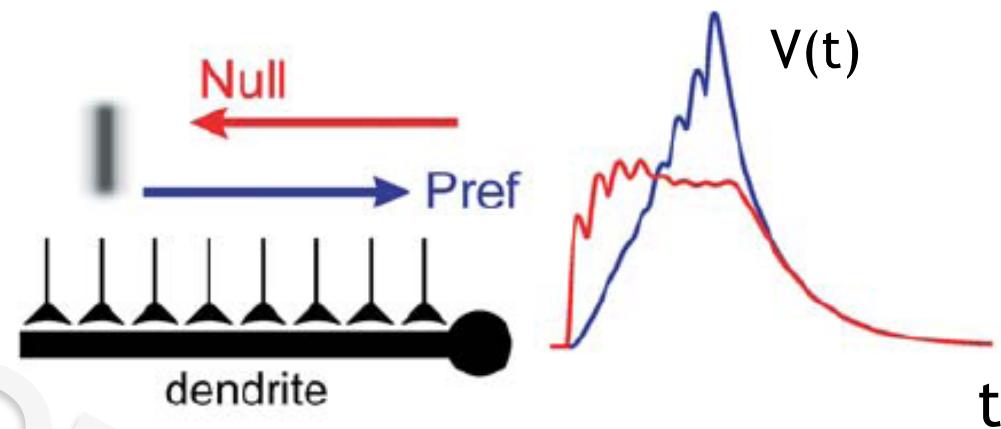

What do dendrites add to neuronal computation?

Delay lines in sound localization

Direction selectivity
